What is claimed is:

1.   A receiving system for acquiring broadcast data through an internet, which comprises:

broadcast reception means for receiving said broadcast data;

5   internet access means for accessing said internet;

monitoring means for monitoring conditions of said receiving; and

control means for switching off said broadcast reception means and switching on said internet access means, when said

10   conditions deteriorate.

2.   The receiving system according to claim 1, wherein said internet access means acquires only non-received modules which have not been received yet by said broadcast reception means.

15   3.   The receiving system according to claim 2, wherein said control means comprises:

memory means for storing in advance a list of names of said modules of said broadcast; and

comparison means for comparing names of modules already

20   received by said broadcast reception means with said list and detecting said non-received modules,

wherein said control means switches off said broadcast reception means and switches on said internet access means, when said non-received modules are detected.

25   4.   A receiving method for acquiring broadcast data through an internet, which comprises the steps of:

receiving said broadcast data;

monitoring conditions of said receiving;

stopping said receiving, when conditions of said receiving

13

deteriorate;

accessing said internet; and

acquiring through said internet said broadcast data which has not received yet.

5. The receiving method according to claim 4, wherein said broadcast data acquired through said internet is an only non-received module which has not been received yet.

6. The receiving method according to claim 5, wherein said stopping step further comprises the steps of:

storing in advance a list of names of said modules of said broadcast; and

comparing names of modules already received with said list and detecting said non-received modules.

7. A computer program product for acquiring broadcast data through an internet, which stores a program for executing the steps of:

receiving said broadcast data;

monitoring conditions of said receiving;

stopping said receiving, when conditions of said receiving deteriorate;

accessing said internet; and

acquiring through said internet said broadcast data which has not received yet.

8. The computer program product according to claim 7, wherein said broadcast data acquired through said internet is an only non-received module which has not been received yet.

9. The receiving method according to claim 8, wherein said stopping step further comprises the steps of:

storing in advance a list of names of said modules of said

14

broadcast; and

comparing names of modules already received with said list and detecting said non-received modules.
